

The Jexis Cavity Release is the perfect solution for accessible housing design. You no longer need to use door pulls or small levers on the edge of the door to pull it out of the wall cavity. With the door flush inside the cavity you simply push the door in and the Jexis cavity release pops the door out from the cavity enough so you can continue to slide it closed. This makes closing your sliding door easy and hassle free.

Installation

Available for new and existing doors, installing the Jexis on your cavity sliding doors is simple, quick and easy. The only tool needed is a drill, a 25mm speed bore bit and a couple of screws. No routing, no chiselling & no mess.

Mounted 1200mm up from the bottom of your door, you will require a hole to a depth of 100mm. Firmly push the Jexis release into the drilled hole and secure with the two screws supplied. Your door will now be ready to install into your cavity.
